Dear Madam,

yesterday we had a conference on the findings of Alexa. We suggest corrective surgery (correction with a systemic right ventricle: closure of the VSD, conduit LV-pulmonary artery, closure of collaterals). Preceding the operation we would close as many collaterals as possible by a catheter intervention.

This is a very difficult operation with an increased risk, nevertheless we decided that the chances for life are better than to leave things as they are. The operation should be performed within the next 6 months.

Now you must decide, whether you want me to give a date for hospital admission. I know that our administration has already sent you an estimation of costs.

Best greetings from Munich,

Andreas Eicken

PD Dr.Andreas Eicken
